Received 21 April 2012; accepted 22 April 2012

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.045;  $wR$  factor = 0.128; data-to-parameter ratio = 13.8.

In the title compound,  $\text{C}_{16}\text{H}_{17}\text{NO}_3\text{S}_2$ , the 2H-chromene ring is close to being planar [maximum deviation = 0.034 (2) Å] and the pyrrolidine ring is twisted about the C—C bond opposite the N atom. The dihedral angle between the ring-system planes is 75.24 (16)° and an intramolecular C—H...S interaction occurs. In the crystal, molecules are linked by C—H...O hydrogen bonds and the packing also exhibits  $\pi$ – $\pi$  interactions, with a distance of 3.6106 (13) Å between the centroids of the benzene rings of neighbouring molecules.

**(6-Methoxy-2-oxo-2H-chromen-4-yl)methyl pyrrolidine-1-carbodithioate**

**N. M. Mahabaleshwaraiah, K. Mahesh Kumar, O. Kotresh, Waleed Fadl Ali Al-eryani and H. C. Devarajegowda**

**S1. Comment**

In continuation of our interest on crystal structures of coumarin derivatives (Kant *et al.*, 2012), we now report the crystal structure of the title compound.

The asymmetric unit of (6-methoxy-2-oxo-2H-chromen-4-yl)methyl pyrrolidine-1-carbodithioate is shown in Fig. 1. The 2H-chromene (O4/C8–C16) ring is close to planar, with a maximum deviation of 0.034 (2) Å for atom C16. The dihedral angle between the 2H-chromene (O4/C8–C16) ring and pyrrolidine (N6/C18–C22) ring is 75.24 (16)°.

In the crystal, (Fig. 2), the molecules are connected via weak C7—H7B···O5, C7—H7C···O4 and C13—H13···O3 interaction hydrogen bonds (Table 1). Furthermore, the crystal structure packing also exhibits  $\pi$ - $\pi$  interactions, with distance of 3.6106 (13) Å between the centroids Cg3 (C8–C13) of the benzene rings of neighbouring molecules

**S2. Experimental**

4-bromomethyl coumarin required was synthesized according to an already reported procedure involving Pechmann cyclization of phenols with 4-Bromoethyl acetoacetate and sodium pyrrolidine-1-carbodithioate was synthesized according to the procedure reported. A mixture of 6-methoxy-4-bromomethyl coumarin (0.01 mol) and sodium pyrrolidine-1-carbodithioate (0.01 mol) in 30 ml dry alcohol was stirred for 24 hrs at room temperature (the reaction was monitored by TLC). The solvent was evaporated and the solid obtained was extracted twice with MDC-H<sub>2</sub>O mixture. The organic layer dried over anhydrous CaCl<sub>2</sub> and on evaporating the organic solvent the title compound can be obtained. The compound was recrystallised from an ethanol-chloroform solvent mixture as colourless plates. Yield = 81%, M.P.435 K.

IR (KBr) 660 cm<sup>-1</sup> (C—S), 1251 cm<sup>-1</sup> (C=S), 1036 cm<sup>-1</sup> (C—O), 842 cm<sup>-1</sup> (C—N), 1279 cm<sup>-1</sup> (C—O—C), 1708.6 cm<sup>-1</sup> (C=O). GCMS: m/e: 335. <sup>1</sup>H NMR (400 MHz, DMSO-D<sub>6</sub>,  $\delta$ , p.p.m.): 1.92 (m, 2H, C<sub>10</sub>), 2.01 ((m, 2H, C<sub>1</sub>), 2.49(m, 4H, C<sub>2</sub>, C<sub>11</sub>), 3.80 (s, 3H, C<sub>9</sub>), 4.86 (s, 2H, C<sub>4</sub>), 6.57 (s, 1H, C<sub>12</sub>), 7.24(m, 1H, C<sub>15</sub>), 7.36 (t, 1H, C<sub>7</sub>), 7.38 (s, 1H, C<sub>16</sub>). Elemental analysis: C, 57.26; H, 5.07; N, 4.15; O, 14.29; S, 19.08.

**S3. Refinement**

All H atoms were positioned at calculated positions C—H = 0.93 Å for aromatic H, C—H = 0.97 Å for methylene H and C—H = 0.96 Å for methyl H and refined using a riding model with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl H and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for other H.

**Figure 1**

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
